

BITFIRST

A community-first fixed-supply token on BNB Smart Chain (BEP-20)

Version	1.0 — DRAFT FOR REVIEW
Date	8 October 2026
Symbol	¥ (U+00A5)
Total supply	369,000,000 (fixed, immutable)
Standard / Chain	BEP-20 · BNB Smart Chain
Contract status	Written and tested on a local EVM. NOT deployed to mainnet, NOT verified on BscScan, NOT audited.
Legal status	No legal opinion obtained. No market price exists. No listing is promised.

1. Abstract

BITFIRST is a fixed-supply BEP-20 token with a single, one-time mint in the constructor. There is no owner mint, no pause, no blacklist and no transfer tax. The full supply of **369,000,000 ¥** is split across six wallets at deployment. Two of those destinations are lock contracts, so the release schedule is enforced by code and visible on-chain rather than resting on a promise.

The project is built around a simple idea: most tokens fail because too much supply is free to move on day one. Here, 60% of supply (221,400,000 ¥) is locked at launch and only 40% (147,600,000 ¥) is liquid.

2. Purpose and scope

This document describes a technical design. It is **not** a prospectus, not an offer to sell any token or security, and not investment, legal or tax advice. Nothing here should be read as a promise of price, profit or listing.

3. Problem

Post-2020, a large number of retail participants entered crypto without understanding supply mechanics. Tokens launched with unlocked founder allocations, hidden mint functions or pause switches. When supply moved, price collapsed. The lesson is structural, not personal: **the release schedule matters more than the narrative.**

4. Solution

BITFIRST addresses this with four concrete choices:

- **Fixed supply.** Minted once in the constructor; no mint function exists afterwards.
- **Code-enforced locks.** Community and team allocations go to lock contracts at deployment — the schedule cannot be revised later.
- **No owner backdoors.** No pause, no blacklist, no transfer tax, no proxy upgradeability.
- **A member ledger.** The community allocation is tracked per member number so distribution is auditable.

5. Tokenomics — 50 / 10 / 10 / 10 / 10 / 10

Total supply: **369,000,000 ¥** (fixed). Decimals: 18.

Bucket	Share	Tokens	At launch	Release rule
Community	50%	184,500,000	Locked	180-day lock; after day 180 released only with owner approval
Liquidity	10%	36,900,000	Liquid	Goes to the PancakeSwap pool
Team	10%	36,900,000	Locked	365-day cliff, then 369,000 every 10 days (100 releases)
Development	10%	36,900,000	Liquid	Held for building; no early selling intended
Charity	10%	36,900,000	Liquid	Guidance: no sale before 6 months
School	10%	36,900,000	Liquid	Guidance: no sale before 6 months
Total	100%	369,000,000	60% locked	40% liquid at launch

Community pool arithmetic: $184,500,000 \div 3,690 = 50,000$ members. Check: $50,000 \times 3,690 = 184,500,000$ ✓

6. Release schedule (verified arithmetic)

Point in time	Team released (cumulative)	Community status
Day 0	0	Locked
Day 179	0	Locked — error text: “Vault: still locked (180 days)”
Day 180	0	Lock ends; a claim still needs owner approval
Day 365	369,000 (first release)	Unlocked by approval
Day 1000	23,406,000	Unlocked by approval
Day 1355	36,900,000 (100 releases done)	—

$100 \text{ releases} \times 369,000 = 36,900,000$ exactly — the schedule terminates precisely on the team allocation.

7. Technology

Solidity **0.8.24**, optimizer enabled (200 runs), MIT licence, **zero imports** — a single self-contained file, which keeps BscScan verification simple. The token contract mints all six allocations in the constructor and rejects duplicate or zero addresses. Two companion contracts handle locks:

Contract	Role	Key mechanism
BITFIRST.sol	BEP-20 token	constructor mints 369,000,000 once; no mint/pause/blacklist
CommunityLock.sol	Community lock	unlockTime = deploy + lockDays; per-member ledger; owner-approved release
TeamVesting.sol	Team lock	cliffDays (365) then intervalDays (10) × 369,000 per release

The member app is a single self-contained HTML file (about 70 KB) that stores everything in the phone's localStorage. It needs no server, no internet, no email and no fee. It includes a Grand Welcome screen, owner login (username **Owner** or **0**), member registration with owner approval, a security-question password reset, and a show/hide toggle on every password field. No password is embedded in the code.

8. Distribution of the community pool

Members are recorded in two steps: first their member number and share, then their wallet address. Until day 180 a member may merge multiple addresses; after the merge the wallet becomes permanent. One member equals one wallet. The community allocation is never sold to members — it is given, at no charge.

9. Roadmap

Phase	Work	Status
0 — Design	Tokenomics frozen at 50/10/10/10/10/10	Complete
1 — Build	Contracts written, tested on local EVM; member app built	Complete
2 — Testnet	Deploy and verify on BSC Testnet (chain 97)	Pending
3 — Mainnet	Deploy and verify on BNB Smart Chain (chain 56)	Pending
4 — Liquidity	Create the PancakeSwap pool and lock LP tokens	Pending
5 — Visibility	Token info on trackers; listing applications	Pending

10. Risk factors

1. No audit. Compiling without warnings proves that the syntax parses; it does not prove the economics are sound.
2. Price risk. A token with no demand trades at or near zero. Liquidity, not the contract, determines the price.
3. Liquidity risk. If the pool is thin, ordinary sells move the price sharply.
4. Key risk. A lost wallet key means permanently lost tokens; there is no rescue function.
5. Lock-design risk. Tokens sent into lock contracts cannot be recovered by anyone. This is intentional and irreversible.
6. Regulatory risk. Token issuance is regulated differently in every jurisdiction. In India, the FIU-IND / PMLA position and the tax treatment of virtual digital assets need professional review.
7. Charity and school allocations. Using a token for charitable or educational purposes carries additional obligations; these must be reviewed before any claim is made to the public.
8. Trademark risk. The BITFIRST name has not been cleared by a lawyer. An earlier candidate name was dropped because of existing marks.
9. Team risk. The team is not yet publicly identified in this document.
10. Utility risk. Concrete token utility is not yet defined and is listed as an open item.
11. Tracker risk. CoinGecko and CoinMarketCap listings are discretionary and can take weeks or be refused.
12. Smart-contract risk. No contract can be guaranteed bug-free.
13. App risk. Data in the member app lives only on the phone that created it. Clearing browser data erases it.

11. Compliance and legal disclaimer

This document is a draft for review. It is not an offer to sell, or a solicitation of an offer to buy, any token or security in any jurisdiction. No regulator has reviewed or approved anything described here. No legal opinion has been obtained. No audit has been performed. No market price exists and none is promised. Anyone acting on this document does so at their own risk and should obtain independent legal, tax and financial advice first.

12. Open items (TBD)

Concrete token utility · team identities and roles · public website · legal opinion · independent audit · issuer entity · India regulatory position · trademark clearance · logo rights · pool quote asset (BNB or USDT) · seed liquidity amount · LP locker and duration · contract address · BscScan verification and metadata · an adverse directory entry found earlier and still unconfirmed · exchange shortlist and budget.

Appendix A — Verifiable constants

Constant	Value
TOTAL_SUPPLY	$369,000,000 \times 10^4$ ■
COMMUNITY_AMOUNT	$184,500,000 \times 10^4$ ■
LIQUIDITY_AMOUNT	$36,900,000 \times 10^4$ ■
TEAM_AMOUNT	$36,900,000 \times 10^4$ ■
DEVELOPMENT_AMOUNT	$36,900,000 \times 10^4$ ■
CHARITY_AMOUNT	$36,900,000 \times 10^4$ ■
SCHOOL_AMOUNT	$36,900,000 \times 10^4$ ■
Community lock	180 days, owner-approved release
Team vesting	365-day cliff, then 369,000 every 10 days

Appendix B — Self-verification checklist

Before any public launch: (1) confirm `totalSupply()` equals $369,000,000 \times 10^4$ ■ on-chain; (2) confirm the six wallet balances match the table above; (3) confirm a claim before day 180 reverts; (4) confirm a claim after day 180 without owner approval reverts; (5) confirm the first team release lands exactly on day 365 and equals 369,000; (6) confirm the contract source verifies on BscScan with the settings listed in section 7.
